Figure S14. Ancestral state reconstructions of cnidops expression outside of eyes (extraocular) and ocular, estimated with a two-state Markov model in the R package corHMM. Each pie chart displays the proportion of marginal likelihood for one state (ocular; red) versus the other (extraocular; black). Circles by species names represent tip states. Opsin with missing expression data or both ocular and extraocular (polymorphic) lack circles. Scale bar represents number of substitutions per site.
